

Experiences of reducing opioid prescribing in UK primary care using enhanced feedback

Dr Sarah Alderson, University of Leeds

Mr Paul Carder, West Yorkshire Research and Development

What do you need to have in place to deliver an A&F intervention in primary care?

Depression in chronic disease

OPTIODS

Rate of prescription per patient count per year

Diabetes control

Blood pressure
control

Anticoagulation
for irregular
heartbeats

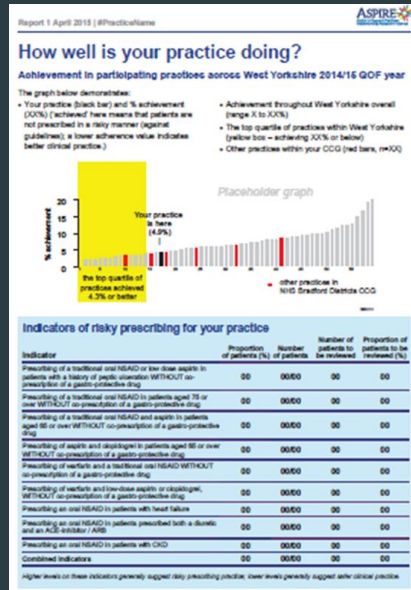

Risky Prescribing

ASPIRE

Action to Support Practices
Implementing Research Evidence

Diabetes contr

Blood pressure
control

Anticoag
for irregular
heartbe

Risky Prescribing

What had we learnt?

- ▶ Recruitment
- ▶ Trust
- ▶ Scaling up
- ▶ Detailed EHR searches
- ▶ Connections

CROP

Campaign to Reduce Opioid Prescribing

How is your practice doing?

1

Achievement in participating practices across West Yorkshire

The graph below demonstrates:

Your practice (black bar) and percentage of the practice population prescribed opioids (354%) in the last 8 weeks; a lower value indicates better clinical practice. The audit data exclude patients with a cancer diagnosis, on the palliative care register or drug addiction diagnosis.

- Achievement throughout West Yorkshire overall (range 3.1 to 13.6%)
- The best achieving practices within West Yorkshire (yellow box – achieving 6.4% or below)
- Other practices within A CCG CCG (red bars)

Your practice achievement on individual indicators:

Risk Factor	Number of patients
Prescribed strong opioids	14
Men aged under 50 years and prescribed strong opioids	2
Patients aged over 75 years and prescribed strong or weak opioid	37
Women aged over 65 years and prescribed strong or weak opioid	53
Polypharmacy (on 10 or more repeat prescriptions) and prescribed strong or weak opioid	93
All mental health diagnoses and prescribed strong or weak opioid	69
Severe mental health diagnoses and prescribed strong or weak opioid	6
Taking antidepressant and a strong or weak opioid	53
Taking benzodiazepines and a strong or weak opioid	35

Report 1 - April 2016 | 1

- Clinical priority
- Locally collected data extracted at scale
- All practices in West Yorkshire (except one!)
- Bimonthly (ASPIRE format) reports for 1 year

Opioid Prescribing

Connections

Who do you need to connect with and build trust with to deliver an A&F intervention in primary care?

Obtaining data

- ▶ National prescribing data available - but includes opioids prescribed in palliative care
- ▶ Practices used to sharing data with CCGs and researchers
- ▶ Not all GPs use the same EHR system
- ▶ Consent to share EHR data added to annual data sharing agreement
- ▶ EHR data able to tailor searches to exclude palliative care patients and identify high risk groups

What data do you have access to and what consent is needed to deliver an A&F intervention in primary care?

What did practices say about the opioid feedback intervention?

"Everybody's ... yes it's the right thing to do. Everybody recognises the prescription of opioids for non-cancer pain... is going out of fashion. It doesn't work and risk of all the other side effects and everybody's had hassles with patients"

"Well I, I mean I'm sure everybody in general practice will tell you the same thing. I've been a GP for 20 years and ... the ... wealth of information we're supposed to digest at the moment is beyond anybody's ability! So to be... the completely honest answer to your question is I don't think there's any way [to make the reports recognisable as something to prioritise]!"

"Actually I opened a can of worms because there was actually disgruntlement across a couple of prescribers that they thought even the bottom quartile was far too high!"

"I think there's barriers about ... patient ... satisfaction levels and what patients want. Particularly since we are moving politically from ... clinical excellence being recognised as a key driver to GP practice, to patient satisfaction."

"Who wants to be opioid champ? But it needs somebody to encourage, to bully, to run the audit. To ... educate the team to continue the downward pressure on reducing it and not initiating it and looking at alternatives and making everybody opioid aware"

What did practices do to reduce their opioid prescribing?

- ▶ Searches and alerts
- ▶ No more repeat prescriptions
- ▶ Sent 'opioid aware' leaflets to patients
- ▶ Practice protocol for starting opioids
- ▶ Consistent message from all GPs

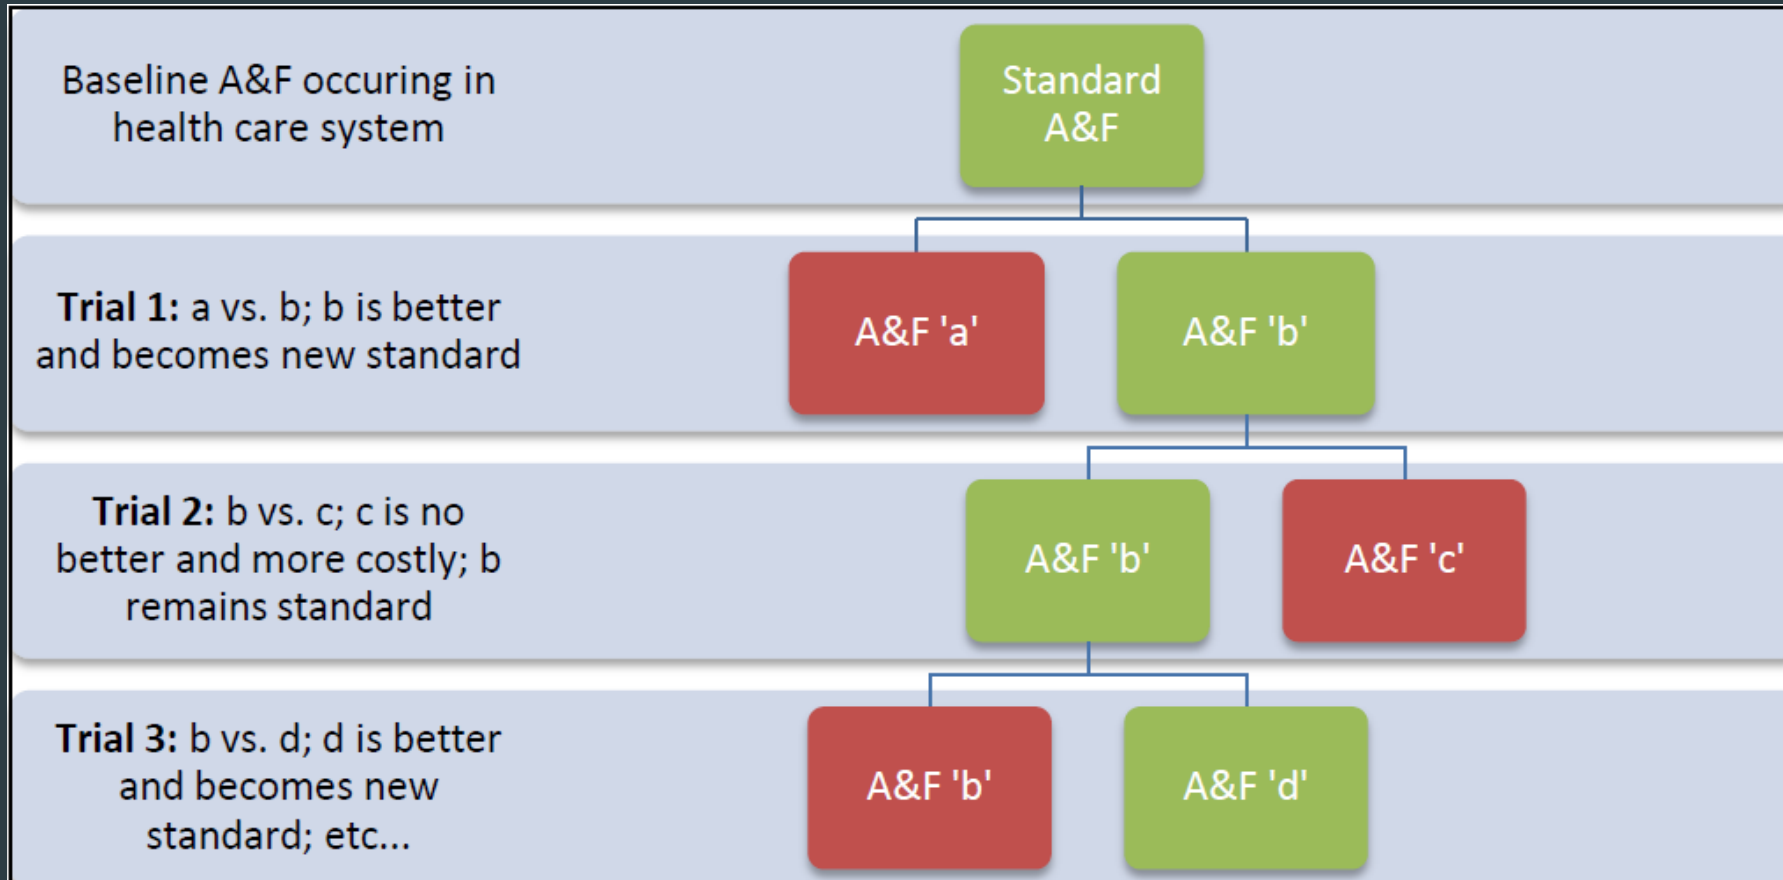

What did we find?

- ▶ Practices that reduced prescribing the most had clear structures for quality improvement
- ▶ Non-prescriptive feedback allowed practices to identify strategies that fit with their way of working
- ▶ Some highlighted that implementation took time and effort, with risks of damage to patient relationships, appointment shortage and competing priorities
- ▶ Getting reports seen by the practice is difficult

What did we do next?

Future Implementation Laboratory

Issues with scaling up - ethics

- ▶ Consent?
 - ▶ Consent practices to take part and be randomised
 - ▶ Consent at commissioner level
 - ▶ Opt-out consent
 - ▶ Waive consent

Issues with scaling up - level of randomisation

- ▶ Increasing networking between practices and commissioning level
 - ▶ Randomise at practice level
 - ▶ Randomise at commissioner level
 - ▶ Randomise at high level

Issues with scaling up - data sources

- ▶ Different data sources with different levels of detail and issues
 - ▶ Nationally available prescribing data
 - ▶ General practice research databases
 - ▶ Extract directly from EHRs

Six learning points from our experience

- ▶ 1. Build relationships
- ▶ 2. Sort data sharing agreements
- ▶ 3. Build trust
- ▶ 4. Consider ethical issues e.g. consent
- ▶ 5. Identify appropriate data sources
- ▶ 6. Have a long-term trajectory

A scene from the movie Guardians of the Galaxy. Baby Groot is standing on a metallic surface, dancing with his arms raised. In the background, there is a large, intense fire or explosion on the left, and a green, hazy environment on the right.

Lunchtime!
